CMOS 8-BIT SINGLE-CHIP MICROCOMPUTER (TLCS-48C)

TMP80C49AP/TMP80C49AP-6
TMP80C39AP/TMP80C39AP-6
TMP80C49AU/TMP80C49AU-6

1. GENERAL DESCRIPTION AND FEATURES

The TMP80C49A is a single chip microcomputer fabricated in Silicon Gate CMOS technology which provides internal 8-bit parallel architecture.

The following basic architectural functions of a computer have been included in a single chip; an 8-bit CPU, 128×8 RAM data memory, $2K \times 8$ ROM program memory, 27 I/O lines and an 8-bit timer/event counter.

The TMP80C49A is particularly efficient as a controller. It has extensive bit handling capability as well as facilities for both binary and BCD arithmetic.

The TMP80C39A/-6 is the equivalent of a TMP80C49A/-6 without ROM program memory on chip. By using this device with external EPROM or RAM, software debugging becomes easy.

The TMP80C49AP/-6 and TMP80C39AP/-6 are in a standard Dual Inline Package.

The TMP80C49AU/-6 is in a 44-pin Micro Flat Package.

FEATURES

- TMP80C49AP/TMP80C39AP/TMP80C49AU

    1.36μs Instruction Cycle Time $-40°C$ to $85°C$, $5V \pm 10\%$

- TMP80C49AP-6/TMP80C39AP-6/TMP80C49AU-6

    2.5μs Instruction Cycle Time $-40°C$ to $85°C$, $5V \pm 20\%$

- Software Upward Compatible with TMP8049AP/INTEL's 8049

- $2K \times 8$ masked ROM / 128×8 RAM

- Low Power

    10mA MAX. in Normal Operation   ($V_{CC} = 5V$, $f_{XTAL} = 6MHz$)
    10μA MAX. in Power Down Mode   ($V_{CC} = 5V$, $f_{XTAL} : DC$)

- Power Down Mode (Stand-by Mode)

- Halt Mode (Idle Mode)

2.2   Pin Names And Pin Description

- V_{SS} (Power Supply)

    Circuit GND potential

- V_{CC} (Power Supply)

    $+5V$ during operation

- $\overline{PS}$ (Input)

    The control signal for the power saving at the power down mode (Active Low)

- PROG (Output)

    Output strobe for the TMP82C43P I/O expander.

- P_{10}-P_{17} (Input/Output) Port 1

    8-bit quasi-bidirectional port (Internal Pullup $\approx 50K\Omega$).

- P_{20}-P_{27} (Input/Output) Port 2

    8-bit quasi-bidirectional port (Internal Pullup $\approx 50K\Omega$).
    P_{20}-P_{23} contain the four high order program counter bits during an external program memory fetch and serve as a 4-bit I/O expander bus for the TMP82C43P.

- DB_0-DB_7 (Input/Output, Tri-State)

    True bidirectional port which can be written or read synchronously using the $\overline{RD}$, $\overline{WR}$ strobes. The port can also be statically latched. Contains the 8 low order program counter bits during an external program memory fetch, and receives the addressed instruction under the control of $\overline{PSEN}$.
    Also contains the address and data during an external RAM data store instruction, under control of ALE, $\overline{RD}$, and $\overline{WR}$.

- T_0 (Input/Output)

    Input pin testable using the conditional transfer instructions JT0 and JNT0. T0 can be designated as a clock output using ENT0 CLK instruction.

- T_1 (Input)

    Input pin testable using the JT1 and JNT1 instruction. Can be designated the event counter input using the timer/STRT CNT instruction.

- $\overline{INT}$ (Input)

    External interrupt input. Initiates an interrupt if interrupt is enabled.
    Interrupt is disabled after a reset. Also testable with conditional jump instruction.
    (Active low)

- $\overline{\text{RD}}$ (Output)

    Output strobe activated during a Bus read. Can be used to enable data onto the Bus from an external device. Used as a Read Strobe to External Data Memory (Active Low).

- $\overline{\text{WR}}$ (Output)

    Output strobe during a Bus write (Active Low). Used as a Write Strobe to External Data Memory.

- $\overline{\text{RESET}}$ (Input)

    Active Low signal which is used to initialize the Processor. Also used during the power down mode.

- ALE (Output)

    Address Latch Enable. This signal occurs once during each cycle and is useful as a clock output. The negative edge of ALE strobes address into external data and program memory.

- $\overline{\text{PSEN}}$ (Output)

    Program Store Enable. This output occurs only during a fetch to external program memory (Active Low).

- $\overline{\text{SS}}$ (Input)

    Single step input can be used in conjunction with ALE to "single step" processor through each instruction when $\overline{\text{SS}}$ is low the CPU is placed into a wait state after it has completed the instruction being executed. Also used during the power down mode.

- EA (Input)

    External Access input which forces all program memory fetches to reference external memory. Useful for emulation and debug and essential for testing and program verification. (Active High)

- XTAL $_1$ (Input)

    One side of crystal input for internal oscillator. Also input for external source.

- XTAL $_2$ (Input)

    Other side of crystal input.

Note 1 : The lower order 4 bit of port 2 output latch are used also for input/output operations with the I/O expander.

Note 2 : The output latch of port 0 is also used for address output.

3. MACHINE INSTRUCTION

The following symbols and codes are used in the list of machine instruction.

Symbol	Meaning
Rr	Working register (0<r<7)
Pp	I/O port address P; (0<p<7)
JBb	Branch instruction in accordance with bit content (b) of operand
aH	Higher order 3 bits of a
aM	Medium order 4 bits of a
aL	Lower order 4 bits of a
aML	Medium order or lower order 8 bits of a
(a)	Content of a
[(a)]	Content of RAM addressed by a
EXT[(a)]	Content of external RAM addressed by a
PRO[(a)]	Content of ROM addressed by a
a<m>	Value at bit position m of a
a<m:n>	Value at bit position m to n of a
a←b	Store a into b
a↔b	Exchange a for b
·	Connection
ā	1 complement of a
a+b	a plus b (Addition)
a−b	a minus b (Subtraction)
a∧b	Logical AND for a and b
a∨b	Logical OR for a and b
a∀b	Exclusive OR for a and b
a=b	a is equal to b
a<>b	a is not equal to b
(a) BCD	Converted value of accumulator

4.8 Timing Waveform

A. Instruction Fetch from External Program Memory
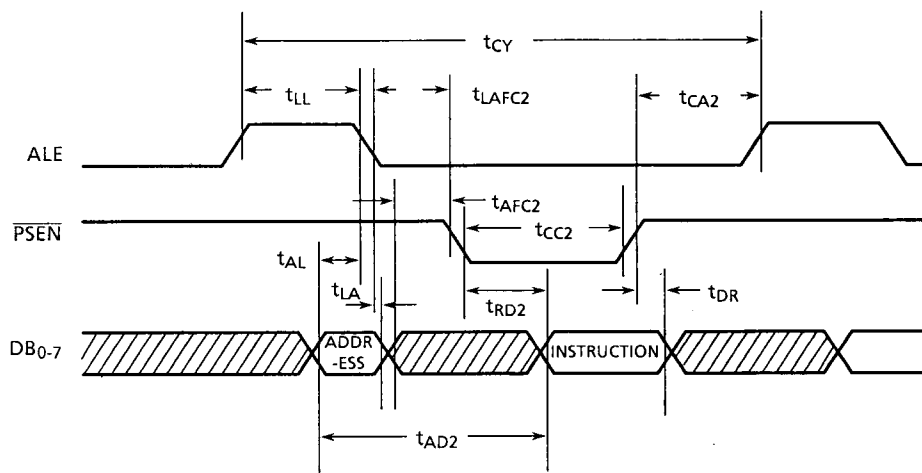

B. Read from External Data Memory
C. Write into External Data Memotry
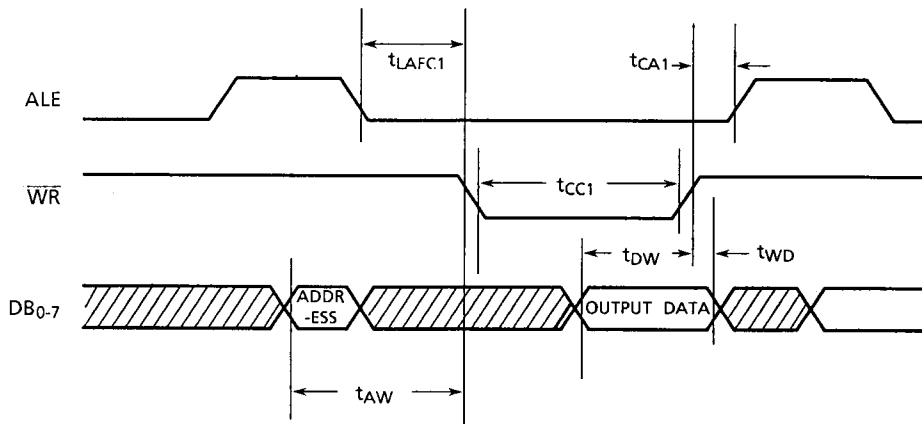

D. Timing of Port 2 during Expandar Instruction Execution
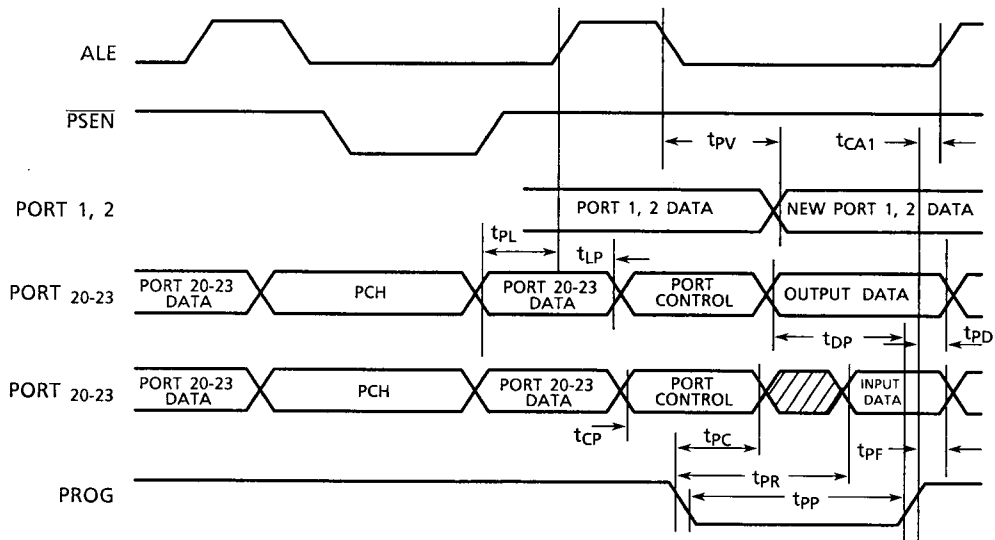

4.9 Stand-By Function

4.9.1 PoweR Down Mode (I) ····· Data Hold Mode in RAM

The operation of oscillation circuit is suspended by setting $\overline{PS}$ terminal to low level after $\overline{RESET}$ terminal has been set to low level. Consequently, all the data in RAM area can be held in low power consumption.

The minimum hold voltage of V_{CC} in this mode is 2V.

$\overline{PS}$ terminal is set to high level to resume oscillation after V_{CC} has been reset to 5V, and then $\overline{RESET}$ terminal is set to high level, thus, the normal mode is restarted from the initialize operation (address 0).

(3)   Timing Waveform
4.9.2 Power Down Mode (II) ····· ALL Data Hold Mode

The operation of oscillation circuit is suspended by setting $\overline{PS}$ terminal to low level after $\overline{SS}$ terminal has been set to low level. Consequently, all data can be held in low power consumption.

The minimum hold voltage of V_{CC} in this mode is 3V.

$\overline{PS}$ terminal is set to high level to resume oscillation after V_{CC} has been reset to 5V, and then $\overline{SS}$ terminal is set to high level, thus, the normal mode is restarted continuously from the state just before the power down mode (II).

(1)   AC Characteristics

(3)   Timing Waveform

4.9.3 HALT MODE

(1)   HALT INSTRUCTION

OP code is "01H". HALT INSTRUCTION is an additional instruction to the standard 8048/8049 instruction set.

(2)   Entry to HALT MODE

On the execution of HALT INSTRUCTION, TMP80C49A/TMP80C39A enter HALT MODE.

(3)   Status in HALT MODE

The oscillator continues its operation, however, the internal clocks and internal logic values just prior to the execution of HALT INSTRUCTION are maintained. Power consumption in HALT MODE is less than 50% of normal operation. The status of each pins are described in the following table.

(4)   Release from HALT MODE

HALT MODE is released by either of two signals ($\overline{\text{RESET}}$, $\overline{\text{INT}}$).

(4.1) $\overline{\text{RESET}}$ Release Mode : An active $\overline{\text{RESET}}$ input signal causes the normal reset function. TMP80C49A/TMP80C39A start the program at address "000H".

(4.2) $\overline{\text{INT}}$ Release Mode   : An active $\overline{\text{INT}}$ input signal causes the normal operation.

● In case of interrupt enable mode (EI MODE), TMP80C49A/TMP80C39A execute the interrupt service routine, after the execution of one instruction which is located at the next address after HALT INSTRUCTION.

● In case of interrupt disable mode (DI MODE), TMP80C49A/TMP80C39A execute normal operation from the next address after HALT INSTRUCTION.

(5)   Supply Voltage Range in HALT MODE

The operating supply voltage range and the operating temperature range are same as in normal operation.

TMP80C49AP/C39AP/C49AU   : $V_{CC} = 5V \pm 10\%$
TMP80C49AP-6/C39AP-6/C49AU-6 : $V_{CC} = 5V \pm 20\%$

4.9.4 Pin Status In Power Down Mode (I) (II)

PIN NAME	STATUS
$DB_0 \sim DB_7$	High impedance Input disabled
$P_{10} \sim P_{17}$	
$P_{20} \sim P_{27}$	
T_0	High impedance, input disabled
T_1	Input disabled
$XTAL_1$	High impedance
$XTAL_2$	Output "High" Level
$\overline{RESET}$, $\overline{SS}$	Input disabled when oscillator is stopped. Pull-up transistors turn off.
$\overline{INT}$, EA	Input disabled when oscilltor is stopped.
$\overline{RD}$, $\overline{WR}$, ALE PROG, $\overline{PSEN}$	High impedance

4.9.5 Pin Status In HALT MODE

PIN NAME	STATUS
$DB_0 \sim DB_7$	Values prior to the execution of HALT INSTRUCTION are maintained.
$P_{10} \sim P_{17}$	
$P_{20} \sim P_{27}$	
T_0	Status prior to the execution of HALT INSTRUCTION is maintained.
T_1	Input disabled
$XTAL_1$, $XTAL_2$	Continue oscillation
$\overline{RESET}$, $\overline{INT}$	Input enabled
$\overline{SS}$, EA	Input disabled
$\overline{RD}$, $\overline{WR}$ PROG, $\overline{PSEN}$	Output "High" level
ALE	Output "Low" level
